

Stronger Frames

To prevent sagging, our 700 Series windows and doors feature sturdy 4-9/16" premium pine frames. Our integral nailing fins, which help hold your windows and doors in place, are made of extruded aluminum for maximum structural stability, instead of the thin, fold-down nailing fins found on most windows.

Worry-Free Exteriors

Our uniquely designed extruded aluminum cladding is fifty percent stronger than thin roll-form cladding used on many other windows. And stronger cladding means better protection against water and air infiltration, denting, and fading.

Energy-Efficient System

Unlike ordinary spacers, Peachtree's unique Real Warm Edge Spacer System keeps the glass temperature consistent—even around the edges—so windows are more energy efficient. Designed with a flexible rubber spacer and a thin metal center for structural integrity, the system also limits expansion and contraction from temperature fluctuations, which reduces condensation, mold, and mildew, as well as the possibility of stress cracks and seal failures in the insulated glass unit.
